

**14.** The apparatus of claim **13**, wherein the wireless device comprises a media player.

**15.** An apparatus comprising:

means for receiving a connection request received from a wireless device;

means for rejecting the received connection request, wherein the apparatus obtains, before the rejecting, information from the received connection request to enable, based on at least the obtained information, a subsequent connection to the wireless device; and

means for initiating the subsequent connection to the wireless device based on at least the information obtained from the received connection request.

**16.** A non-transitory computer-readable storage medium including computer program code, which when executed by at least one processor circuitry causes operations comprising: receiving a connection request received from a wireless device; and

rejecting the received connection request, wherein information is obtained, before the rejecting, from the received connection request to enable a subsequent connection to the wireless device; and

initiating the subsequent connection to the wireless device based on at least the information obtained from the received connection request.

**17.** The non-transitory computer-readable storage medium including computer program code of claim **16**, wherein the obtained information includes an identity of the wireless device.

**18.** The non-transitory computer-readable storage medium including computer program code of claim **16**, which when executed by at least one processor circuitry causes further operation comprising adding the identity of the wireless device to a connection list to enable the subsequent connection over a short-range link, the connection list comprising a media player list
